

A real GitHub trace that looks safe to compile

Issue #6602 — “Index error when data is large”

record → labels → comments(limit=3)

Naive substitution

recur + replay → ship

45/45 tool replays

4 requests → 1

tool contract passes

But the answer has a live-out

expected: Markdown link

compiled: link text only

tool contract = pass

answer contract = fail

GAC: compile only what the evidence can justify

full candidate: RETIRE

comments.limit: ungroundable

no consistent expression

emit record → labels

leave comments + rendering with the agent

92/92 at $\alpha=.05$ · upper bound 0.0498

Continuation guard

detects comment_evidence:mismatch

checked render: 18/18 pass

provider-free mechanism check;

not live safety evidence
